- Topic 3 - The Trial Solution Method

## Topic 1 - ODE Review

- Definitions and Classification
- Engineering Applications
- Example

# What is a Differential Equation?

*Definition:*

A **differential equation** is an equation which describes a function and one or more of its \_\_\_\_\_ of the \_\_\_\_\_  
\_\_\_\_\_ with respect to the \_\_\_\_\_.

## Standard Form of an ODE

Ordinary Differential Equations are written in the following form.

$$a_n \frac{dy^{(n)}}{d^{(n)}x} + a_{n-1} \frac{dy^{(n-1)}}{d^{(n-1)}x} + \dots + a_2 \frac{dy^2}{d^2x} + a_1 \frac{dy}{dx} + a_0 y = f(x)$$

The apostrophe is commonly used for the derivative.

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + \dots + a_2 y'' + a_1 y' + a_0 y = f(x)$$

If time is the independent variable the equation changes slightly.

## Is the differential equation ordinary or partial?

An **ordinary** differential equation has \_\_\_\_\_ independent variable and \_\_\_\_\_ dependent variable.

A **partial** differential equation has \_\_\_\_\_ independent variable \_\_\_\_\_ dependent variable.

## What is the order of the equation?

The **order** of a differential equation is the

\_\_\_\_\_

present in the equation.

## What is the degree of the equation?

The **degree** of a differential equation is the \_\_\_\_\_  
of its highest derivative, after the equation has been made rational  
and integral in all of its derivatives.

## Is the differential equation linear or non-linear?

An ordinary differential equation is \_\_\_\_\_ if the following statements are true.

- 1 *The dependent variable and its derivatives are of the first degree.*
- 2 *The coefficients are constants or dependent on the independent variable.*

If either rule is broken, the equation is \_\_\_\_\_ - \_\_\_\_\_.

## Engineering Applications

Differential equations are used to describe physical systems in many areas of engineering. An equation that represents a physical (or theoretical) system is known as a \_\_\_\_\_.

- Solid Mechanics
- Kinematics and Dynamics
- Heat Transfer and Thermodynamics
- Fluid Mechanics

# Engineering Applications

## Example

Newton's Second Law

$$\Sigma F = ma$$

leads to an *equation of motion*.

$$\dot{y} + \frac{c}{m}y = f(t)$$

## Topic 2 - Separation of Variables

- Review
- Separation of Variables
- Example

# What is a Differential Equation? Solution?

A **differential equation** is an equation which describes a function and one or more of its \_\_\_\_\_ of the \_\_\_\_\_ with respect to the \_\_\_\_\_.

The **solution** to a differential equation describes the \_\_\_\_\_ as a function of the \_\_\_\_\_.

# Separation of Variables

Separation of Variables: **analytical** for solving differential equations

- Step 1 - Separate
- Step 2 - Integrate
- Step 2 - Solve for Unknowns

# Separation of Variables

Alternative methods to find solution:

- -

- -

- -

## Problem Statement

Remember our example from the previous lecture?

$$\dot{v} + \frac{c}{m}v = f(t)$$

We are going to find an **analytical solution** to this problem.

## Separation of Variables

Assume the external force  $f(t)$  is zero. Use separation of variables to find the solution  $v(t)$ .

$$\dot{v} + \frac{c}{m}v = 0$$

## Solution

The solution  $v(t)$  has been found. What does it mean? What do we do next?

$$v(t) =$$

## Solution

The solution  $v(t)$  has been found. What does it mean? What do we do next?

$$v(t) =$$

## Graph of Solution

What does the solution look like?

$$v(t) = v_0 e^{-\frac{c}{m}t}$$

## Topic 3 - The Trial Solution Method

- Exponential Assumption
- Complementary Solution
- Particular Solution
- Apply Initial Conditions
- Summary - 3 Cases

## Trial Solution Method

Use the **trial solution method** to solve the ODE.

This is an **analytical** method that you learned in calculus but it may have been called something different. In the Zill book it is called *Homogenous Linear ... Constant Coefficients (4.3-4.4)*.

$$a_2y'' + a_1y' + a_0y = f(x)$$

# Exponential Assumption

## Complementary Solution

Step 1 - Find the **complementary part** of the solution from the left hand side of the ODE alone (LHS=0).

$$a_2 y'' + a_1 y' + a_0 y = f \quad \rightarrow \quad a_2 y'' + a_1 y' + a_0 y = 0$$

Assume an exponential solution for the complementary part.

$$y_{\text{complementary}} = y_c(x) =$$

Substitute this solution into the ODE (LHS=0).

## Particular Solution

Step 2 - Find the **particular part** of the solution from the entire equation (LHS=RHS).

$$a_2 y'' + a_1 y' + a_0 y = f$$

The *form of the particular part* follows the RHS of the ODE.

$$y_{\text{particular}} = y_p(x) =$$

Substitute this solution into the ODE above and solve for any unknown constants in  $y_p(x)$ .

## Apply Initial Conditions

Step 3 - Now combine the **complementary** and **particular** solutions through *superposition*.

$$y(x) = y_c(x) + y_p(x) =$$

The ODE is first order and we have \_\_\_\_\_ unknown. Coincidence?

$$y(x) =$$

This **initial value problem** requires \_\_\_\_\_ initial condition.

## Apply Initial Conditions

$$y(x = 0) =$$

$$y'(x = 0) =$$

## Apply Initial Conditions

What does the solution look like this time?

$$y(x) =$$

# Apply Initial Conditions

## Summary - 3 Cases

If the differential equation is first and linear, the complementary solution takes the following form.

$$y(x) = Ae^{sx}$$

## Summary - 3 Cases

If the differential equation is second order and linear, the **complementary solution** takes one of the following forms.

Case 1:  $s_1, s_2 \in \mathbb{R}$  ,  $s_1 \neq s_2$

$$y(x) = c_1 e^{s_1 x} + c_2 e^{s_2 x}$$

Case 2:  $s_1, s_2 \in \mathbb{R}$  ,  $s_1 = s_2 = s$

$$y(x) = c_1 e^{sx} + c_2 x e^{sx}$$

Case 3:  $s_1, s_2 \notin \mathbb{R}$  ,  $s_1, s_2 = \alpha \pm \beta i$

$$y(x) = e^{\alpha x} (c_1 \cos(\beta x) + c_2 \sin(\beta x))$$

## Summary - 3 Cases

The **particular solution** takes the form of the right hand side of the equation.

Example	Form	Particular Solution
$\dots = 10$	Constant	$y_p = B$
$\dots = 12x$	Linear	$y_p = Bx + C$
$\dots = 20e^{2x}$	Exponential	$y_p = Be^{2x}$
$\dots = a\cos(\beta x)$	Sinusoidal	$B\cos(\beta x) + C\sin(\beta x)$
$\dots = a\sin(\beta x)$	Sinusoidal	$B\cos(\beta x) + C\sin(\beta x)$
