## An Integral Transform

The Laplace Transform is an Integral Transform

Given a function  $x(t)$  in the time domain where  $t \geq 0$ ,  
the Laplace Transform is defined as follows:

$$X(s) = \mathcal{L}\{x(t)\} = \int_0^{\infty} x(t)e^{-st} dt$$

And its inverse is similarly defined as:

$$\mathcal{L}^{-1}\{X(s)\} = x(t)$$

The Laplace Domain variable  $s$  is a complex number:

$$s = \sigma + j\omega$$

## Laplace Transform of A Derivative

It is useful to find the laplace transform of the derivative of a function:

$$\mathcal{L}\left\{\frac{d}{dt}(x(t))\right\} = \mathcal{L}\{\dot{x}(t)\} = s\mathcal{L}\{x(t)\} - x(t=0)$$

$$= sX(s) - x(t=0)$$

$$\mathcal{L}\{\dot{x}(t)\} = sX(s) - x_0$$

$$\mathcal{L}\left\{\frac{d^2}{dt^2}(x(t))\right\} = \mathcal{L}\{\ddot{x}(t)\} = s^2\mathcal{L}\{x(t)\} - sx(t=0) - \dot{x}(t=0)$$

$$= s^2X(s) - sx(t=0) - \dot{x}(t=0)$$

$$\mathcal{L}\{\ddot{x}(t)\} = s^2X(s) - sx_0 - \dot{x}_0$$

## Properties of an Integral

Also, remember that the transform inherits the properties of an integral.

$$\int [x(t) + y(t)] dt = \int x(t) dt + \int y(t) dt$$

$$\int Kx(t) dt = K \int x(t) dt \quad (K \text{ is constant})$$

Therefore these properties can be used with the Laplace transform.
